

Advice for Potatoes

General

We advise to apply N-xt soil fertilizers during planting, though it is also technically possible to apply them before or after planting. Apply the soil fertilizer close to (and under) the tubers, around 5-10 cm from each tuber. Start using N-xt foliar fertilizer *immediately* after tuberization. With our foliar fertilizer you will be able to determine the exact dose and the right type of nitrogen for your crop to grow more tubers in the same size. Regular soil analysis are important for reliable advice!

Recommended formulas for 1st phase

Before, during or after planting

Depending of the amount of nitrogen and phosphorus per hectare, there are two soil-fertilizers with good practical experiences: 1) **N-xt NP 9-8 B S Zn**

2) **N-xt NP 22-2 B S Zn**

Together with planting the potatoes, there is a possibility to spray on the tubers; **N-xt FertiVital**. This is a plant strengthener (contains micro-nutrients and bacteria) which will have a resilience on Rizoctonia.

After planting and before ridging the soil there is treatment recommended for better quality, skin and scab on potatoes.

Spraying with 7-hole nozzle of raindrop:

N-xt Calcium (N9 with Boron)

Recommended formulas for 2nd phase

Start using N-xt foliar fertilizer after tuberization

For specific points of attention look at the foliar-leaflet!!

N-xt N18 Ca Mg Mn (first 2 times)

N-xt NPK 18-0-3 Mg B Zn (rest of season)

Gezonde bodem, vruchtbaar resultaat
