

N-xT fertilizers Golf and Sport

- Even growth and better root development
- The turf is more resistant to fungal diseases and foot traffic
- Unique nutrients for a healthy colour
- Prevents germination of weeds and wild grasses
- Unique N-xT fertilizers for a positive effect on the soil structure

Nxt strategy for golf courses and sports grounds

Because of their unique properties, Nxt fertilizers have been proving their worth on grass areas, golf courses and sports grounds for many years. Its organic properties contribute to the activity of the soil biology. This makes the soil much better able to contribute to healthy growth on the basis of its own natural strength. As a result less input is required, while leading to improved soil conditions over time. Working on the correct soil balance is part of the "Nxt strategy", using various products and soil analyses. It starts with a thorough assessment and inspection of the grounds. An important target value in each soil is, for example, the calcium/magnesium/potassium ratio. This is different for each type of soil. We can calculate this on the basis of a Kinsey-Albrecht soil analysis.

Balanced growth gives healthy turf with a permanent green colour!

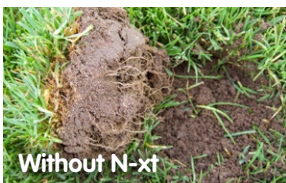

Nxt Sport

The Nxt fertilizer formula for golf courses and sports grounds occurs in different variants. For the spring application we use "Nxt Sport Spring". In addition to the basic minerals, it contains many micronutrients that support the biological processes in the soil. Towards the autumn, "Nxt Sport Winter" is used. It has a little bit more potassium and phosphate, which strengthens the grass plants for the winter period. It also helps prevent diseases, so that sports grounds, fairways and greens emerge healthy from the winter.

In mid-season, the special "Nxt Sport Calcium" fertilizer can provide better resilience and balanced growth. The liquid fertilizers can all be sprayed with a fertilizer cap (see photo).

The right strategy will give stronger turf, suitable for heavy use by people walking and playing sports.

Basic advice

Spray Nxt Sport with a fertilizer cap

- 1-2 l/100m² solved in 50-100 l water
 - Repeat once every 2-3 weeks on poor soil
 - Repeat once every 3-4 weeks on fertile soil

Extra spring fertilization

Be aware that in early spring the soil biology is still at a very low level. We can activate the soil with the right mixture of bacteria and fungi combined with the Nxt fertilizers that help accelerate the growth process. Extra Nxt products can be added, depending on the soil requirements and circumstances. Ask us about the advantages of the "Ferti line" products, such as

- Nxt Ferti-RS
- Nxt Ferti-Soil
- Nxt Ferti-Life
- Nxt Ferti-S
