

## Advice in Cereals

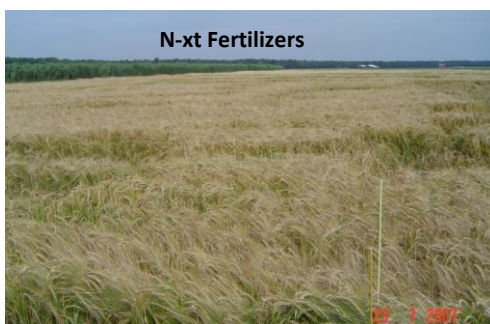

### General

Nxt Fertilizers has developed a range of fertilizers that can be dribbled above or injected into the ground. For summer cereals (seeding in spring) this must be applied before or directly after the sowing. For winter cereals we advise also to fertilize in the fall, just after the sowing. In early spring we fertilize just before the plants start to grow and during the season we control the growing by applying 1 or 2 treatments with a Nxt Foliar. With a more constant growth we can achieve an earlier ripening and a better yield. Regular soil analysis are important for reliable advice!

### Strategy (no slurry used):

- Directly after sowing in fall: Terra **Nxt NPK 3-3-7 Mg Mn**, sprayed with raindrop or 7 holes nozzles
- Directly after sowing in spring: Terra **Nxt NP 22-2 B Zn S**, for a good root system development (7 hole nozzle)
- At Feekes scale 2 (*extra gift soil*): Terra **Nxt N22-2 B Zn S** for extra tillering, root development and start (7 hole nozzle)
- At Feekes scale 5: Folium **Nxt N18 Ca Mg Mn** as foliar application
- At Feekes scale 7: Folium **Nxt N18 Ca Mg Mn** as foliar application
- At Feekes scale 10 (Not after): Folium **Nxt N18 Mg S** as foliar application

**Gezonde bodem, vruchtbaar resultaat**
